

## Issues Identified & Approach to Fixing

Before touching any code, I went through the starter files to find the errors and work out fixes.

### HTML Issues

The starter code didn't use real semantic HTML, everything was wrapped in generic divs like `<div class="header">` and `<div class="footer">`. I replaced these with proper header, nav, main, section, article, and footer elements, and added the missing lang attribute, charset meta tag, and viewport tag across all four pages.

There was no navigation menu, so pages didn't link to each other. I built one nav bar (Home, About, Projects, Contact), kept identical on every page. Every image was also missing alt text, fixed with a short description each.

Two bigger gaps stood out: the About page was meant to have a data table but didn't, and the Projects page was missing its third project. I built the table with proper `thead/tbody` structure and added the missing project to match the other two.

The contact form needed the most work. It used placeholder text instead of labels. This was a problem since placeholders vanish once typing starts and screen readers don't reliably read them, so I added `<label for>` elements linked to each input's id. It only had two input types, both text, so I added email, a dropdown, and a radio group. There was no validation either, so I added required and minlength, and fixed the submit button, which was missing `type="submit"`.

### CSS Issues

The stylesheet barely used any selector variety (just two or three types), with no ID, descendant, or pseudo-class selectors. I expanded this to include those plus attribute selectors, and added hover/focus states to the nav, buttons, and form fields.

One bug was a real contrast failure, light text on a light blue background in the hero. I rebuilt the palette and checked every combination against the 4.5:1 WCAG ratio. Another was a footer left-aligned instead of centred, flagged directly in a code comment. Beyond those, there wasn't any styling for the nav, table, or form, since none existed in the starter code, so I built it all alongside the HTML fixes, with margin, padding, and border used deliberately throughout.

### Code Quality

Lastly, I cleaned up the comments and structure. The original had barely any comments, so I added ones explaining actual decisions rather than labelling code and reorganised the stylesheet to follow the page's element order.
